Industrial inspection microscope

The JBM-MZ50 auto inspection microscope by JB Instrument is a solution for industrial inspection, suitable for electronics, automotive, and precision manufacturing.

Advanced features like 'zoom fusion' enable seamless transitions between wide and close-up views, while enhanced image analysis supports customised applications. Its user-friendly interface ensures intuitive operation, maximising productivity. Combining high-quality optics and software, this microscope sets new standards for precision, speed, and efficiency in quality control and industrial inspection processes.

High-speed optical micrometer

Keyence's LS-7000 series optical micrometer uses optical technology to measure with high speed and accuracy. The

system supports dual measuring heads, real-time comparisons, and data export via its controller. It includes trans-

parent object detection, trend graphing, and real-time image capture for complex shapes. It is IP64-rated for reliable operation in harsh environments, suited for manufacturing and production lines.

AUTOMATION

Automated final test manipulator

ESMO Group introduces ARES Auto Setup, the world's first automated final

test manipulator for semiconductor manufacturing. Designed for automation

engineers, production managers, and R&D teams, it enhances productivity, quality, and

reliability. ARES streamlines testing processes, saving time and costs while meeting strict production deadlines.

3D measurement and inspection software

Teledyne DALSA's Canadian team has developed the Z-Trak 3D Applications Studio, a robust software suite for in-line 3D measurement and inspection. Designed for the Z-Trak laser

profiler family, it simplifies tasks like surface inspection, thickness measurement, weld seam analysis, and defect detection on complex geometries and materials. Ideal for industries such as electronics, automotive, and packaging, it ensures precision and efficiency in challenging environments.

MISCELLANEOUS

Graphics cards for gaming and AI

Intel has introduced the Arc B-Series graphics cards, codenamed Battlemage, designed for modern gaming

and AI applications. Intel's XeSS 2 boosts frame rates, smoothness, and responsiveness. With up to 12GB memory, advanced settings for VRR,

overclocking, and low-latency modes, they excel in gaming and AI tasks.

EDA software suite

Keysight Technologies has introduced its EDA 2025 software portfolio to address technology demands, including 5G/6G and data centre solutions.

Leveraging AI, machine learning, and Python integrations, the tools accelerate RF, chiplet, and high-speed digital design workflows. Engineers benefit from automated processes, multi-domain simulation, and AI-enhanced insights, reducing design and verification time.

BCD platform for analogue and mixed-signal solutions

Onsemi introduces the Treo Platform, leveraging 65nm Bipolar-CMOS-DMOS (BCD) technology for versatile analogue and mixed-signal solutions. Designed for high-performance,

low-power, and efficient applications, it addresses demands for energy-efficient solutions

in automotive, industrial, healthcare, and AI-driven data centres. Key benefits include enhancing safety with advanced ultrasonic sensors in cars, improving accuracy and comfort in medical wearables with ultra-low-power analogue front ends, and optimising power delivery in data centres for sustainable operations.
