TECHNOLOGY

COMPONENTS

Power management IC

ABLIC's new S-19560B series PMIC dramatically reduces power-supply footprint for automotive camera modules by integrating two DC-DC converters and an LDO in a tiny 2mm × 3mm package, enabling

up to ~20% board-area reduction vs competitors. It supports 16V input, improves thermal and noise performance, and comes preconfigured for common sensor sequencing. The design targets high-resolution rear, surround-view, driver-monitoring and ADAS camera systems where space, stability, and integration matter most. ABLIC Inc.

MRAM modules

Everspin's new EM064LX HR and EM128LX HR MRAM modules deliver non-volatile memory that keeps data

intact and performs reliably. Designed for aerospace, defence, automotive ECUs, and

industrial systems, they pair fast, sustained read/write performance with a high-speed QSPI interface, helping engineers protect data integrity and uptime in harsh thermal, vibration, and shock environments.

Encoder

Faulhaber Group's new ultra-compact incremental encoder delivers metrology-grade positioning with 0.1° accuracy and 0.007° repeatability in tight-motion systems, using optical

sensing and on-chip signal processing to deliver a clean output even in noisy

environments. Available in 22mm, 32mm, and 42mm formats with a built-in line driver, it suits optical instruments, semicon-

ductor tools, precision automation, and compact robotic axes where size, precision, and stable feedback are essential.

xSPI flash

GigaDevice's new GD25NX xSPI NOR flash delivers native 1.2V I/O to an octal-SPI interface, enabling direct

connection to low-voltage SoCs without booster circuits, reducing system power and

BOM costs while supporting up to 200MHz/400MB/s throughput. It is designed for wearables, edge AI nodes, compact automotive systems, and dense data-centre gear where energy, size, and performance constraints are tight.

SuperQ MOSFETs

iDEAL Semiconductor's new SuperQ MOSFETs boost short-circuit safety in

high-voltage battery packs by significantly increasing short-circuit withstand capability (SCWC), letting switches

survive external faults with up to 1.4x higher current tolerance than typical

MOSFETs. With ultra-low on-resistance and ratings up to 200V, they reduce component counts, simplify layouts, and improve efficiency and safety in e-bikes, drones, and professional power tools, where robust fault tolerance is critical.

Ultra-junction MOSFET

Littelfuse's new MMIX1T500N20X4 ultra-junction MOSFET tackles common high-power design pain points by

delivering 480A at 200V with just ~1.99mΩ RDS(on) in a compact SMPD-X

package, cutting conduction losses and reducing the need for paralleled devices. Its topside cooling and low gate charge simplify thermal and PCB layout. It's suited for DC load switches, battery storage systems, industrial power supplies, charging infrastructure, and high-demand mobility platforms like drones/VTOLs.

10BASE-T1S endpoint devices

Microchip's LAN866x 10BASE-T1S endpoint devices remove software and MCUs from many peripheral nodes

by bridging single-pair Ethernet directly to local digital interfaces for lighting, audio, sensors, and small actuators in zonal vehicle networks.

Using RCP and a 10BASE-T1S multidrop bus, they cut wiring, integration work, and node-level code while letting central compute manage data and diagnostics, supporting Ethernet-centric designs in software-defined vehicles.
