

Edge-processing modules

ADLINK's new NXP i.MX95-based AI and edge-processing modules bring local intelligence to compact systems

by combining high-performance CPU

cores with an onboard neural processor for up to ~2 TOPS of AI inference in space- and power-constrained designs. They handle on-device tasks such as vision, real-time analytics, and sensor fusion without cloud dependence, and are used in smart sensors, portable medical analysers, compact robots, and intelligent city/industrial endpoints.

Debugger

Percepio's Detect 2025.2 addresses one of the most complex parts of embedded firmware development—intermittent freezes, CPU overloads, and timing bugs that traditional debuggers often miss—by running a lightweight

TaskMonitor in firmware that monitors CPU activity per thread and automatically captures traces when anomalies occur. Captured data integrates with Tracealyzer for post-mortem analysis without manual triggers.

Dual-output power module

Advanced Energy's latest dual-output 400W module for its NeoPower configurable power supply family fits a 2.5-inch (6.35cm) slot. It delivers two isolated 24V rails from a single AC input, enabling designers to configure up to 16 isolated

outputs without custom supplies. The compact, digitally controlled module targets industrial systems, medical equipment, semiconductor test gear, and measurement platforms, where flexible power staging, reduced complexity, and high density speed development simplify complex power architectures.

Production-ready IoT board

Conclusive Engineering's KSTR-IMX93 board is a production-ready IoT platform that integrates secure connectivity and multi-protocol radios on a single board to ease the transition from prototype to

product. It integrates Wi-Fi 6, BLE 5.4, Thread, ZigBee, LTE-M/NB-IoT, GNSS, PoE,

Gigabit Ethernet, and CAN-FD with NXP's i.MX93 and Nordic radios, and supports Linux/Zephyr with hardware-secure boot. This mix targets edge devices, industrial IoT gateways, and always-connected sensors with OTA and optional on-device AI inference support.

MANUFACTURING EQUIPMENT & MATERIALS

Robotic soldering platform

A new collaborative robot-based soldering platform automates traditional piston soldering to cut cycle times and boost throughput in electronics assembly. The system uses a teach-in interface to set solder paths and parameters without programming expertise, and integrates iron and wire feed on the robot arm for repeatable joints. It adapts from manual loading to inline conveyor

setups, targeting scalable PCB assembly, device manufacturing, and other high-mix production lines.

Automated assembly equipment

Nordson Electronics Solutions' latest automated assembly equipment is accelerating electronics production by reducing key bottlenecks in soldering, coating, and dispensing. The SELECT

Synchro selective soldering system boosts PCB throughput by 20-40% while handling single- and double-sided, as well as mixed-tech, boards. Complementary ASYMTEK coating and dispensing

platforms enable controlled conformal coats and precise material deposition. These systems are in use in automotive electronics, industrial controls, telecommunications, and medical device lines.

TEST & MEASUREMENT

Multi-TAP test controller

A new robust multi-TAP test controller is entering electronics development and production test workflows, with enhanced JTAG boundary-scan performance, cleaner signal paths, and configurable TAP mapping to speed board-up and debugging. The controller's four configurable TAPs, ±30V pin protection, and up to ~166MHz scan speeds support both prototype labs and factory floors, helping engineers with early hardware validation, JTAG functional testing, and volume production checks.
