What's New In SPI?

INNOVATION	DESCRIPTION	KEY BENEFIT
AI-Driven 3D Defect Classification	AI/deep-learning models analyse volumetric 3D paste data to classify defects such as insufficient, excessive, bridging, slump, and shape irregularities. Auto-learning improves accuracy over time	Reduces false calls by 30-50%; improves yield; minimises operator dependency, ideal for high-mix SMT lines
Metrology-Grade 3D Volumetric Measurement	True 3D measurement using multi-fringe Moiré, DLP projection, or MRS technology (<10µm repeatability). Measures volume, area, offset, height, shape, and even non-paste materials	Ensures 99% yield on fine-pitch (01005/micro-BGA); detects issues missed by legacy 2D SPI
Shadow-Free Multi-Angle 3D Imaging (8-20 projections)	Multi-angle projection eliminates shadowing, enabling accurate reconstruction between tall or uneven components	Reduces shadowing errors by 40%+ and improves accuracy on complex assemblies and warped PCBs
Inline High-Speed Continuous Scanning	Linear motors, multi-camera sensors, and parallel image capture enable inspection at 50-100 boards/min, depending on design complexity	Cuts SPI cycle time by 20-35%; avoids bottlenecks in automotive and telecom production
Multiple-Resolution Switching (Dual-Mode Imaging)	Machine switches automatically between high-speed/low-res mode and high-resolution/precision mode for fine-pitch areas—all in a single inspection cycle	Balances speed + accuracy: 20-30% faster inspection while maintaining micron accuracy for 01005/micro-BGA
Closed-Loop Printer Feed-back (Smart Factory 4.0)	SPI communicates with printers (DEK/MPM) for auto-correction of alignment, pressure, speed, cleaning cycles, and paste distribution	Reduces print defects by 40-60% and stabilises long production runs
AI-Native Combined SPI + AOI Platforms	Newer systems combine SPI and AOI on the same platform
