

“Anyone With A Product Idea Can Come To Us; We Can Design Both The Chip And The Complete Product Around It”

SRINI CHINAMILLI
CEO, TESSOLVE

How is India powering the next generation of AI chips? What does it take to design high-compute, high-power semiconductors from scratch? To answer these questions, EFY's Vidushi spoke with Sridhar Chinamilli and explored how Tessolve is shaping the future of chip design in India.

What does Tessolve do, and how would you define its core strength?

Tessolve supports the entire chip lifecycle, from architecture and design through product engineering, evaluation, testing, and system development. We provide a world-class platform that enables customers to bring semiconductor products to market faster and more efficiently.

Do you also have your own R&D team?

We operate a Centre of Excellence focused on advanced semiconductor development. This includes work on cutting-edge data centre AI chips built on the most advanced process nodes. Our earlier R&D efforts have enabled us to develop deep expertise in chiplets and high-power, high-compute AI architectures.

What differentiates Tessolve from other semiconductor engineering service providers?

Tessolve operates as a semiconductor company at every level, from leadership to engineering teams. We are among the few providers offering genuine end-to-end capability, spanning chip architecture, design, testing, product engineering, and productisation.

Who exactly are your target customers, and which industries are driving

the most demand?

Our core customers are semiconductor companies involved in chip design and productisation, including more than 80% of the top 20 globally. We also work with non-semiconductor organisations on systems design, particularly in industrial and automotive applications, with clients including Lufthansa Technik, Schneider, and Harman.

How has Hero Electronix influenced Tessolve's growth and direction?

Hero Electronix has been part of our journey since 2016 and has played a significant role in supporting our growth. Their financial strength has allowed us to make bold investments, strengthen lab infrastructure, and pursue acquisitions, including the \$50 million acquisition of DreamChip in Germany. More recently, TPG's \$150 million investment has further strengthened our ability to accelerate growth.

What semiconductor trends are you closely watching?

The most significant trend we are tracking is AI. AI is driving the development of highly complex, high-power chips with massive compute and memory requirements, demanding innovation across design, testing, and systems. Beyond AI, trends such as vehicle

electrification, smarter vehicles, and industrial predictive analytics are shaping demand; however, AI remains the dominant driver.

What challenges do you face in the Indian market?

Talent remains a key challenge, particularly as semiconductor activity continues to grow in India. We address this through structured training programmes for engineers and university faculty, helping scale the workforce to meet industry demand. Another challenge is securing risk capital to support advanced semiconductor development, which is critical for startups and long-term growth.

Where do you see Tessolve in the next five to ten years?

We aim to become a complete end-to-end partner for chip and product design. From initial concept through to complete system delivery, we want customers to rely on us for the entire journey. Over the next five years, our ambition is to triple in size while maintaining a strong international presence anchored by a predominantly India-based workforce. **EFY**
