

ELECTRONIC VOTING SYSTEM

With Real-Time Authentication And Keypad

RAKESH JAIN

A secure electronic voting system with real-time authentication and keypad enables accurate, tamper-proof voting through identity verification and

controlled access. Voters authenticate using unique credentials before casting votes through a keypad interface. The system enhances transparency, prevents duplication or fraud,

and records votes securely, making the electoral process faster, more reliable, and suitable for modern democratic environments.

The system offers a secure, efficient, and practical biometric voting approach by combining fingerprint authentication with keypad-based candidate selection. The prototype is shown in Fig. 1, and the

BILL OF MATERIALS

Components	Quantity
Arduino Uno (MOD1)	1
R305 fingerprint sensor (MOD2)	1
20x4 LCD display (LCD1)	1
Push-to-on switch (SW1-SW4)	4
Buzzer (B1)	1
10k potmeter (R1)	1
Breadboard	1
USB cable	1
