1 ANEDYA ENABLING FASTER AND EFFICIENT IoT ADOPTION FOR OEMs

This Gujarat-based startup streamlines IoT adoption with a scalable cloud backend tailored for OEMs and smart devices.

Anedya architecture

Anedya, a deep-tech startup founded by Chinmaya Mahanta and Markand P. Pathak, operates in the Internet of Things (IoT) domain, offering a specialised cloud platform designed to streamline and accelerate IoT adoption for original equipment manufacturers (OEMs). The company focuses on the cloud layer, delivering a plug-and-play backend that connects smart devices to end-user interfaces.

“Our solution eliminates the need for OEMs to build complex cloud infrastructure from scratch, reducing development time by six to seven months and removing the need to hire dedicated cloud engineers. We provide backend as Infrastructure-as-a-Service (IaaS), purpose-built for IoT applications,” explains Chinmaya.

The primary users of Anedya’s services are OEMs that manufacture devices such as smart water purifiers, electric vehicles, smart home products, industrial equipment, and cold storage systems. When these manufacturers aim to add smart features—like monitoring water quality or enabling remote operation—Anedya facilitates the transformation.

Markand explains that the process typically involves three core components: hardware equipped with Wi-Fi or GSM-based chips, Anedya’s cloud backend, and a mobile or web application for the end-user. “Our platform ensures seamless integration between the hardware and the app, enabling reliable data communication, efficient device management, and robust control capabilities,” he adds.

Any IoT-capable hardware can be used with Anedya’s services. “We support such applications by offering hardware-facing protocols like MQTT and HTTPS, and we provide SDKs compatible with popular microcontroller platforms such as ESP32 and STM32,” says Markand. He adds that the open source SDKs enable firmware developers to implement essential logic with minimal setup.

Chinmaya shares that ‘Anedya’ is a Sanskrit word meaning infinity, reflecting the company’s vision of managing millions of devices and billions of data points with scalability and efficiency.

The startup operates from its headquarters in Ahmedabad, Gujarat, with a compact team of eight professionals, including backend developers and embedded engineers. Their infrastructure includes a basic electronics lab with a primary focus on software development and cloud architecture. All core technologies and innovations have been developed in-house, including a proprietary MQTT broker that handles millions of concurrent device connections, a custom database optimised for IoT data called the Value Store, and a comprehensive over-the-air (OTA) update mechanism.

Anedya places strong emphasis on IoT security. To enhance safety, the platform restricts non-TLS/
