

TABLE 3
INTERACTIVE CASE STUDY

Segment	Investment-to-turnover ratio	Capital intensity	Incentive level
Camera modules	1:23	High	Higher (to offset risk)
Display assemblies	1:4	Moderate	Standard

This differentiated model ensures that even the most capital-intensive segments receive the support needed to scale effectively.

to qualify for incentives; final assembly from semi-assembled products is not eligible. Similarly, for camera module sub-assembly, the complete process, including surface mounting, front on line (FOL), and end of line (EOL) procedures, must be performed in India, and final assembly from semi-assembled products is excluded from incentives. For multi-layer PCBs, from the second year onwards, applicants are required to localise at least one part or component each year, such as process chemistry material, finished chemistry material, solder mask ink, tin balls, or solder.

Enclosure eligibility requires manufacturing from metals, plastics, or glass in India, with finishing or decoration included in the manufacturing process. For Li-ion cells, applicants must ensure that the cells are intended for digital applications (excluding storage and mobility), with a capacity not exceeding 10,000mAh, and in prismatic, pouch, or cylindrical form. From the second year, localisation of at least one component, such as electrolyte, anode electrode, or cathode electrode, is required each year to continue receiving incentives.

Unlike earlier schemes, ECMS was shaped with deep industry input through consultations with associations like Elcina, global consulting firms, and direct feedback from manufacturers. This led to:

- **Product-specific incentives.**

Higher support for capital-intensive, low-turnover segments (e.g., camera modules) and tailored packages for each vertical

- **Support for R&D and design.** Encouraging indigenous innovation and prototyping, not just assembly

- **Non-fiscal enablers.** Streamlined land, utility, and licensing approvals; logistics and export facilitation; quality certification support

Applicants must ensure their proposed investment meets the minimum threshold criteria to qualify for target segments D under the ECMS scheme. They are required to demonstrate financial capability by submitting a net worth certificate that is no older than March 31, 2024. The applicant's net worth should be at least 50% of the proposed investment; if this is not met, a board resolution confirming the committed investment and its funding source must be provided. The net worth is calculated in accordance with Section 2(57) of the Companies Act, 2013, based on the latest audited balance sheet.

Additionally, applicants must make either greenfield or brownfield investments in the manufacturing target segment goods, submit separate applications for each target segment product, and only one application is allowed per target segment product. Applications acknowledged but not considered under SPECS may be reviewed under ECMS if they meet the necessary criteria. Finally, the governing council will assess both technological and financial capabilities when selecting applicants for the scheme.

Vision and the roadblocks ahead

The push for import substitution in

JBC Tools

RMSE Station

– A Complete Rework Station

JBC Tools

RMSE Station, equipped with MSE Module, ensures :

- Efficient and precise solder removal
- Powerful suction system.
- Fastest and safest solution for soldering and rework
- Including hot air applications
- ESD Safe - Meets ANSI/ESD S20.20-2021 Standards
- Sleep & Hibernation Modes help to extend tip life and reduce energy consumption.

The station features stackable modules and it includes all the necessary accessories to simplify your work.
