COMPONENTS

Hydrogen Leak Detection Sensor

Honeywell has launched a next-gen hydrogen leak detector, offering real-time detection of hydrogen leaks

as small as 50 parts per million. Ideal for hydrogen applications in industrial,

energy and transportation sectors, it integrates seamlessly into storage, piping, generators, and vehicles. Using advanced thermal conductivity detection technology, it ensures early leak identification, enhancing safety.

2kA Compact Protection Thyristor

Littelfuse, Inc. has introduced the Pxxx0S3G-A SIDACtor protection thyristor series, the first 2kA thyristor in a compact DO-214AB (SMC) package. This space-saving solution offers robust surge protection for demanding applications, including EV systems (OBCs, battery chargers), industrial automa-

tion, renewable energy (solar inverters, storage systems), and ICT (UPS, power grids). With automotive-grade compliance and enhanced durability, it supports miniaturisation without sacrificing reliability or performance, ideal for modern high-power designs.

First GaN Transistor with Diode

Infineon Technologies has launched the CoolGaN G5, the world's first industrial-grade gallium nitride (GaN) transistor with an integrated Schottky diode. The

transistor enhances power system efficiency and simplifies design, addressing chal-

lenges like reverse conduction losses. Key applications include server and telecom IBCs, DC-DC converters, USB-C chargers, PSUs, and motor drives. The CoolGaN G5 reduces dead-time losses, eliminates the need for external diodes, and supports optimised performance in various industrial systems.

Low-Power Microcontrollers

Renesas Electronics has launched the RA0E2 group microcontrollers, expanding the RA0 series with low-power,

cost-effective solutions for applications like consumer electronics,

small appliances, industrial controls, and building automation. They are software-compatible with RA0E1, easing hardware/software reuse across embedded platforms.

Power Management IC

Microchip Technology's MCP16701 power management IC (PMIC) is

designed for AI-powered applications

in edge computing, data centres, and industrial systems.

It streamlines power delivery for MPUs and FPGAs with eight 1.5A

buck converters, four 300mA LDOs, and a MOSFET controller.

SOMs For Embedded Systems

MYIR has expanded its SOM lineup with the MYC-YR3506 and MYC-YR3562, targeting diverse embedded applications.

It suits low-power IoT and smart displays, offering efficient perfor-

mance and multimedia support. It is ideal for industrial automation, AI, edge computing, and IoT gateways, featuring a powerful processor, AI acceleration, and rich I/O. Both Linux-based modules deliver scalable, application-specific solutions across entry-level to performance-intensive embedded systems.

2.5kW DC-DC Converter

Navitas Semiconductor, in collaboration with Great Wall Power, has launched a 2.5kW DC-DC converter optimised for AI-driven data centres. The converter

supports 400V DC systems, reduces space usage, and

improves thermal performance. With applications in AI servers, telecom, and industrial systems, it ensures energy efficiency and compact power delivery in space-constrained environments.
