1 "THIS STARTUP ENABLES WIRELESS CHARGING OF YOUR VEHICLES!"

Dash Dynamic Private Limited, a Delhi-based startup, is transforming electromobility with its advanced wireless charging solutions.

(L-R) Shashank Sawai and Robin Singh, Founders of Dash Dynamic Pvt Ltd

Founded in 2020 by Robin Singh and Shashank Sawai, Dash Dynamic is a deep-tech startup committed to transforming the electromobility sector through advanced wireless charging technology. Robin notes that conventional plug-in chargers are ill-suited for a future dominated by electric vehicles due to their bulky infrastructure and ongoing maintenance demands. This realisation led to the development of Dash Dynamic's wireless charging system, which removes the need for cables and physical charging stations. With this solution, drivers can simply park over a ground-embedded pad and

initiate charging via a mobile app, without leaving the vehicle.

Explaining the company name, Robin says, "Dash Dynamic" reflects its dual vision. 'Dash' represents fast, effortless static charging—where users just park and charge—while 'Dynamic' signals the future possibility of charging vehicles in motion.

The wireless charging system comprises two components: one is installed inside the vehicle during manufacturing, and the other is embedded in the ground. This setup allows electric vehicle users to charge by parking over the charger. The accompanying mobile application offers a full Internet of Things

(IoT) experience, enabling users to monitor the state of charge, track charging duration, and control the process remotely.

Dash Dynamic's wireless charging technology is being developed for two-wheelers, four-wheelers, and drones. For drones, a 700-watt charger has been designed to extend operational range, currently being piloted with manufacturers under a B2B model. Chargers for two-wheelers are rated at 1200 watts, while four-wheeler systems operate at 11 kilowatts.

The startup primarily targets electric vehicle manufacturers and charge point operators, with a dual-focus strategy ensuring that wirelessly enabled vehicles are supported by compatible infrastructure. Dash Dynamic also caters to UAV (unmanned aerial vehicle) manufacturers, two- and four-wheeler EV makers, and both private and public charge point operators.

The company has filed for a patent and anticipates approval soon, with 30 additional patents in the pipeline to protect its intellectual property.

Regarding installation, Robin highlights the system's cost-effectiveness. Unlike conventional plug-in stations, which require extensive civil works such as canopies and plinths, Dash Dynamic's charger
