

can be placed either above or below ground and secured with cement. This significantly reduces both complexity and cost.

“Safety is one of the key benefits of this non-contact technology,” Robin adds. “The system includes foreign object detection, automatically halting charging if an object or animal enters the area. It also complies with international electromagnetic safety standards, making it safe even for individuals with pacemakers.”

Currently, Dash Dynamic operates as a design and development company. Manufacturing is outsourced to Indian SMEs and MSMEs, while final assembly and testing are conducted in-house for pilot deployments. Commercial production will commence once agreements are secured with EV manufacturers and charge point operators.

The startup is in a pre-revenue

phase and has raised \$1 million to develop and pilot its wireless charging technology. Its commercialisation path includes completing pilot testing with EV manufacturers, obtaining certifications (an eight-month process), and launching in the market by early 2027.

The wireless charger includes smart features such as remote monitoring, usage analytics, and complete mobile app integration. It is engineered to withstand extreme weather conditions and holds an IP67 rating, ensuring protection from water, mud, and other environmental factors.

Looking ahead, Dash Dynamic is focused on building a wireless charging ecosystem for all categories of electric vehicles, including future prospects such as cycles and heavy-duty trucks. The company is also exploring dynamic wireless charging, where vehicles charge

while in motion, addressing range anxiety. A retrofit model for vehicles not originally equipped by OEMs is also planned, though this remains a long-term goal, projected for rollout 3-4 years after the static charging system’s commercial launch.

Dash Dynamic is headquartered at the Research and Innovation Park at IIT Delhi and operates with a 15-member team. The core team is led by Dr Kiran Pandav, an expert in converter design, and Dr Pushpendra Yadav, a specialist in coil design. Both hold advanced degrees in wireless power transfer and have led their respective teams through the technology’s development and refinement.

For future production, the company plans to partner with large conglomerates willing to establish manufacturing lines based on order volumes.

2 “WE AIM TO BE A GLOBAL BRAND—ONE THAT HAPPENS TO BE FROM INDIA, NOT JUST AN INDIAN ALTERNATIVE.”

From design to development and manufacturing, Univlabs in Gurugram is setting new standards in surgical innovation, which is entirely made in India.

“Every journey has three phases—rejection, apprehension, and acceptance,” says Sunil Singh, Founder and CEO of Univlabs. “We built Univlabs to endure them all.” In 2015, Sunil asked a bold question: Can India build world-class surgical tech, by Indians, for Indian needs, and still compete globally? Today, Univlabs is that answer—trusted in operating rooms across India and beyond, proving that innovation can be made, not imported.

Behind every product is a team that combines medical insight with deep-tech expertise. Sunil Singh leads the way, joined by Co-founder Dr Anil

Mandhani, one of India’s foremost urologists. The broader leadership includes veterans from top healthcare and technology companies such as Novartis, Kerry Bio Science, and Karl Storz. This is a team that blends clinical credibility with a sharp focus on execution—and above all, they share a belief that India can lead, not follow, in MedTech.

Univlabs stands out in MedTech by offering innovative, high-quality, and affordable medical devices that are fully designed and manufactured in India. Unlike competitors who rely on imported parts and local assembly, Univlabs develops

Univlabs 4K Endo Vision Surgical Suite

everything in-house—including electronics, mechatronics, mechanical components, and software—ensuring full control over quality, cost, and customisation. It is among the few Indian companies building complete endoscopy and urology
