

systems from the ground up.

Their systems are highly modular and customisable. While traditional devices are rigid and require costly, time-consuming international coordination for changes, Univlabs provides adjustable, flexible modes that allow surgeons to customise image and colour settings to meet their precise surgical needs. Local design and service capabilities enable faster support and greater adaptability.

They have integrated artificial intelligence into their 4K endoscopy tower, enabling remote surgical collaboration. Expert surgeons anywhere in the world can watch live surgeries, annotate in real time, and guide the operating surgeon through a secure, AI-powered interface. This is the first such solution of its kind developed in India and is being built at Univlabs' Bengaluru office under the leadership of R&D Director Sreedhar Anjanappa.

Univlabs is innovating surgical solutions with a focus on safety, performance, sustainability, and automation. Gurpreet Singh, head of R&D, highlights Am-SafeX, a catheter with markers to prevent urethral injury, and a biodegradable ureteral stent in development with IIT Roorkee. These innovations demonstrate a focus on safety, sustainability, performance, and automation. Recognised by the Ministry of Electronics and IT, DGHS, and Armed Forces surgeons, Univlabs

Sunil Singh, Founder and CEO, Univlabs

has delivered 36x returns on the Ministry's investment. Customer feedback averages 4.5 stars for quality, documentation, and service.

By leveraging local suppliers, in-house R&D, and vertically integrated manufacturing, Univlabs delivers products that match or surpass the functionality of global brands at significantly lower prices. Its devices are developed in line with required quality standards such as ISO 13485 and IEC safety standards. The design process adheres to global best practices and is managed using internationally recognised and accredited tools and methods, ensuring high reliability and traceability.

Looking ahead, Univlabs is preparing to incorporate robotics and advanced AI into its surgical platforms. Prototypes of next-generation cameras and integrated systems are under development—technologies

currently dominated by global giants such as Stryker and Olympus. Univlabs, however, aims to deliver these at accessible price points for Indian hospitals and clinics, including those in Tier 2 and Tier 3 cities.

Univlabs, with 16 patents (4 granted), offers highly customisable surgical products for diverse specialities and hospital sizes. Its adaptability ensures faster, more reliable service, earning the trust of top hospitals across India, including AIIMS and Fortis. Among the top four players in India's endovision surgical instruments market, Univlabs competes with global firms valued at over \$12 billion. The company is expanding rapidly, serving healthcare providers across India and in overseas markets globally.

Univlabs isn't positioning itself as a low-cost alternative to Western brands—it's redefining surgical innovation with a focus on quality, proudly from India. "We do not just want to be an Indian alternative to global brands," says Sunil. "We want to be the global brand that just happens to be from India." This mindset is already transforming operating rooms across the country. With engineers, surgeons, and visionaries at the helm, Univlabs is driving the next wave of smart, accessible, and homegrown healthcare technology—building the future of surgery, one procedure at a time.

3 "ADVANCED LIQUID ROCKET ENGINES FOR SPACE AND DEFENCE APPLICATIONS BY THRUSTWORKS"

Pune-based Thrustworks designs liquid rocket engines and supplies propulsion systems for space and defence launch vehicles.

Thrustworks Dynetics is a private limited propulsion technology company founded in 2023 and headquartered in Pune, India. It is led by a founding team of three: Manan Joshi, who oversees

business operations; Kalyani Shinde, the CTO driving technological innovation; and Vinith Shenoy, who manages design, manufacturing, and operations.

The startup focuses on
