The New Rulers of the Skies: Drones

Equipped with Diotec MOSFETs DI200N04PQ

With the continuous development of technology, drones have become important players in many fields. These robots can fly and stay autonomously in the air for a long time, and can perform various professional tasks such as promotional videography, search and rescue, transportation and sprinkling or are simply used for fun. Drones usually consists of multiple electronic modules, each with a different function and role. The motor control module is one of the most important modules in any drone as it controls the flight direction and stability of the drone.

In the motor control module, MOSFETs are used to control the motor speed, thereby controlling the flight direction and stability of the drone. Power MOSFETs are ideal for this application due to its durability, reliability and fast switching speeds which in turn allow the drone to perform its tasks to a very high level of precision. We need to choose the correct MOSFETs carefully. Diotec has a broad range of MOSFET products that can perfectly match the needs of various modules within the drone. The DI200N04PQ from Diotec Semiconductor is a 200A/40V N-channel Super Trench Power MOSFET in a small QFN5x6 package, ideally suited to power and motor control applications, ready to deliver the best switching characteristic. With a low RDS(on) of typically 0.95 mOhm it plays a crucial role while enhancing system performance, to meet these condition, very low on-state resistance helps improve the heat dissipation performance of the DI200N04PQ. The low gate charge (Qg) of 92nC improve the efficiency and power density of the DI200N04PQ.
