

significantly reducing energy losses.

How do you ensure the safety of your chargers and batteries during operation?

Our chargers incorporate six to seven layers of protection, including voltage regulation, reactive load handling, and temperature monitoring. Safety components such as high/low cut-off devices, fuses, and relays are integrated into the hardware and are governed by operating logic and predefined temperature and voltage ranges.

For example, in extreme heat, our chargers employ a 'derating' mechanism that limits current output until the temperature normalises, after which it resumes maximum output. For batteries, our proprietary battery management system (BMS) regulates performance under various conditions, such as

frequent braking or steep inclines. It also compensates for poor charging infrastructure in some areas, ensuring batteries adhere to safety standards and operate optimally.

Additionally, we proactively incorporate global best practices and comply with government standards, continuously enhancing safety and performance across all our products.

How do you ensure the interoperability of chargers across different vehicle types?

Our chargers are designed to be fully interoperable, ensuring compatibility with all types of vehicles. This is particularly critical for public charging infrastructure, where the vehicle type—whether Tata, MG, or another brand—is unpredictable. Before launching a new product, we conduct extensive testing with various vehicles in the market.

For two-wheelers and three-wheelers, the scenario is still evolving. A few years ago, multiple standards—up to five or six—caused inconsistencies. However, with the government's push for standardisation, we are collaborating with OEMs to develop interoperable products for these vehicles. Most two- and three-wheelers can use the 3.3-kilowatt industrial socket as a baseline charging option. Beyond this, higher-power charging requires additional customisation.

Overall, our products are designed to meet the needs of diverse vehicles, ensuring seamless charging compatibility across the market. **EFY**
