“India Offers EXCEPTIONAL ACCESS TO TALENT In Silicon Design, Software Engineering, AI Development”

FORD TAMER
CEO, LATTICE SEMICONDUCTOR

Recognising India's design potential, Lattice Semiconductor has established an R&D centre in Pune to develop innovative FPGA solutions. In an exclusive conversation with EFY's Yashasvini Razdan, Ford Tamer answers the question—Why India?

What are the challenges in the electronic semiconductor industry that Lattice intends to address with an R&D centre in Pune?

Major challenges include shortening design cycles and increasing costs in advanced process nodes (for example, 3 nanometres and 2 nanometres). FPGAs provide flexibility by enabling rapid prototyping and software updates, avoiding the high costs and long timelines associated with application-specific integrated circuits (ASICs). For fast-evolving areas like security and AI, FPGAs offer adaptability to changing requirements. Our Pune design centre focuses on developing vision,

security, and edge AI solutions to address these challenges.

Why should an electronics embedded design company design in India?

India offers exceptional access to talent in silicon design, software engineering, and AI development, aligning with our hiring objectives. Despite intense competition for skilled professionals, the region remains cost-effective.

We compete with major global companies like Google and Amazon to hire highly skilled AI and machine learning experts, silicon designers, and digital signal

processing (DSP) software engineers. Having a global footprint allows us to leverage the unique strengths of different locations while optimising operational costs.

Do you view India as a consumer market or as a talent pool for developing solutions?

Both. This centre designs solutions for customers worldwide and tailors products for local and multinational companies in India. For instance, we collaborate with semiconductor companies, electronics manufacturing services (EMS) providers, and major local players like Bharat Electronics Ltd (BEL)
