Bridging Electronics and Photonics in Semiconductors

AI, HPC, and data center demands are outgrowing traditional interconnects. With speeds hitting 224G PAM4, signal integrity and power are key challenges. Silicon photonics offers a breakthrough integrating optics on silicon. Ansys HFSS and Lumerical MODE enable seamless co-design and optimization across optical and electrical domains.

Key Applications

- Co-packaged optics for AI accelerators
- Chiplet-based optical interconnects in 2.5D/3D ICs
- Integrated PIC + SerDes designs

Our Solution

HFSS + Lumerical MODE: A Unified Simulation Platform

Simulation Workflow

- Photonic Device Design (Lumerical MODE)
- Optical Circuit Layout (Lumerical INTERCONNECT)
- Electrical Routing and Packaging (HFSS)
- Hybrid Interface Modeling (HFSS + MODE)

Performance Outcomes

- Lower design risk with virtual prototyping
- Align signals across chiplet interconnects
- Boost bandwidth & energy efficiency
- Speed up time-to-market via simulation
