

## TRULY INNOVATIVE: TECH

GmbH's SSE6030 module addresses this by providing a supercapacitor-based 60V DC UPS that replaces conventional batteries. Designed for 24V, 48V, and 60V systems, it ensures power continuity in temperatures from -30°C

to +55°C. With 24.1Wh of energy storage, it delivers up to 158 seconds of backup at a 4A load, allowing safe shutdowns or continued operation during outages. Its aluminium housing and full encapsulation protect it from humidity, vibration, and mechanical stress, ensuring long-term use in industrial settings.

## Sensor ICs

Traditional magnetic and optical

encoders can be large, expensive, and wear out over time, especially in tough industrial environments. Renesas

Electronics has solved this with its new magnet-free inductive position sensor ICs, the RAA2P3226, RAA2P3200, and RAA2P4200. These sensors are precise, durable, and work in many applications like robotics, motor drives, valves, and medical or home automation systems. They use non-contact coil technology to measure rotary, linear, or arc positions with a simple metal target, eliminating the need for magnets or optics and requiring little maintenance. They resist heat, vibration, moisture, and stray magnetic fields, giving accurate readings better than 0.1% and a reliable, compact, and cost-effective alternative to traditional encoders.

## Dual-input sensor IC

Modern vehicles require accurate torque and angle measurements for steering systems, but using two single-

channel or magnetic sensors increases cost, complexity, and PCB space. The Melexis MLX90514 combines dual-input inductive sensing with on-chip computation of differential and vernier angles, processing signals from two coil sets to eliminate extra ICs and reduce host processing load. It supports steering torque feedback, steering angle sensing, and rack motor

control in steer-by-wire systems. It can integrate external PWM signals from other sources and allows compact coil designs for smaller, integrated modules, simplifying design and lowering bill-of-material costs.

## Laser sensor for motion

Manufacturers struggle to measure the speed, length, and position of moving materials because contact sensors,

such as wheels or encoders, slip, wear out, or require maintenance, leading to delays and errors. Aeva Eve 1V solves this with a non-contact sensor using FMCW laser technology, tracking continuous materials like webs, sheets, and rolls, as well as discrete items, with submillimetre-per-second accuracy, even in start-stop operations. It eliminates slippage and mechanical wear, works on soft, smooth, or textured surfaces, and provides repeatable measurements. The sensor integrates into production lines with minimal disruption, using low-power, industrial-grade interfaces and encoder-compatible outputs, offering a practical alternative to wheel encoders and laser velocimeters.
