SoCs

Designers of connected devices often struggle with running multiple wireless protocols, handling computing tasks, and keeping data secure without adding extra parts. Silicon Labs' SiMG301 and SiBG301 solve this by separating tasks for applications, wireless, and security, allowing devices like lights, switches, sensors, and controllers to function while reducing extra parts. The SoCs also help manufacturers get certifications and keep software and security up to date, meeting rules for safety and data protection.
