Transceivers

Many IoT devices lose connectivity in remote areas. Semtech's LR2022 and LR2012 transceivers enable long-range wireless and satellite links while minimising power consumption. They give engineers flexibility to design affordable, globally connected IoT products for agriculture, logistics, and smart infrastructure where conventional networks can't reach or stay reliable.

Compact resistor

Engineers designing compact power electronics need precise current measurement without heat issues. Vishay's WSLF1206 power metal strip resistor delivers high accuracy, minimal loss, and 20x greater power density in a small form. It saves board space while ensuring efficiency in applications like power tools, motor drives, robotics, and industrial automation.

Smart switches

Automakers face complex wiring and safety demands as vehicles go electric. ROHM's BV1H-BxxxEFJ smart switches replace mechanical fuses and multiple ECUs with programmable, protected load control. They simplify design, improve reliability, and enhance diagnostics, helping engineers build safer, lighter,

software-defined vehicles ready for zonal architectures.

Digital microphones

Designers of portable audio devices need low-power microphones without losing sound quality. Infineon's digital microphones IM72D128V and IM69D129F provide high clarity with minimal current draw, extending battery life. They deliver reliable audio capture for wearables, earbuds, and IoT devices used in noisy or power-constrained environments.

Automotive MOSFETs

Automotive electronics demand compact, inspectable power components for reliability. Nexperia's MLPAK MOSFETs enable safer solder joints, better optical inspection, and simplified assembly. They enhance durability and efficiency in body control, lighting, and infotainment systems, giving carmakers a dependable and cost-effective solution for space-constrained designs.

EMBEDDED SYSTEMS

Compact module

Industrial and medical developers struggle to add multimedia and AI to small devices. ARIES Embedded's MSRZG3E SiP combines ARM cores and an AI engine into one compact module. It simplifies integration, enabling real-time control, dual-display support, and faster prototyping for embedded systems needing both

processing and graphics.

Linux distro

Porting AI applications across embedded hardware is often slow and complex. Avocado OS streamlines this by offering a Linux platform that runs consistently from prototyping to production. It enables secure, updatable, and scalable AI deployments at the edge, helping embedded developers to speed up the process without compromising reliability.

Avocado OS

Switch module

Developers often battle with unreliable switch modules due to their bouncy feedback. Mightyonics' debounced switch module fixes this issue with built-in circuitry that ensures stable, noise-free input detection. It simplifies prototyping and enhances reliability in projects by using counters, state machines, and interactive electronics, benefiting students, engineers, and makers alike.

Tracker

Factories often waste time on manual asset audits in warehouses. inVirtus Technology's EosFlex automates tracking through Bluetooth-based positioning, offering real-time visibility of equipment and materials. It helps industrial operators reduce downtime, improve efficiency, and digitise workflows for smart factory and logistics management systems.
