the go. Small enough to fit in a bag or pocket, these compact devices are making projection more mobile and accessible.

A standout example is the MoGo projector, launched by XGIMI in 2020. About the size of a small loaf of bread, it combines built-in AI, Google TV, and Bluetooth speakers—essentially a smart TV you can carry anywhere.

Another model in the pocket-size category is Kodak's Luma 75, known for its compact design and basic use for small projection on the move.

Most mini projectors use LCD or LED DLP technology, keeping them lightweight, cost-effective, and power-efficient. While premium versions incorporate laser systems, pocket-sized models favour

simplicity to maintain portability.

A newer entry is the Flip Projector from Aurzen. About the size of a Samsung flip phone, it stands upright in a Z-shape. It does not have a built-in OS, but mirrors content wirelessly from a smartphone. Just set it down, point it at a wall, and start streaming.

For those looking for sound and image in a portable form, Hisense's C2 Ultra is a room-to-room model that adds audio without requiring speakers.

While they cannot match full-sized projectors in performance, pico projectors offer unmatched convenience, ideal for travel, casual viewing, or quick movie nights. As they evolve, they are redefining how and where we watch content.

Ultra-short-throw projectors

Ultra-short-throw (UST) projectors can display a large image from a short distance. For example, the Epson 4K PRO-UHD1 can project an 203cm (80-inch) picture from just 2.3cm away, and can scale up to 381cm (150-inch) with a slight increase in distance.

With standard projectors, people often stand between the projector and the screen, blocking the image and causing glare. UST projectors avoid this by being placed in front of the viewing area, close to the wall. This keeps the picture clear and the light out of the viewers' eyes.

Interactive models often use UST technology, enabling users to write or draw on the image, control a computer from the wall display,
