COMPONENTS

Automotive-qualified MOSFET

Nexperia has launched its first automotive-qualified MOSFET range in

compact micro-lead packages, designed for body control, infotainment, LED lighting, and reverse battery protection. The 19 new devices offer

safety, design flexibility, and efficient production with reliable soldering and high assembly yield. Compact, robust, and cost-effective, they help engineers meet evolving automotive power demands with confidence.

LDO regulators

ABLIC Inc. unveils the S-19230/1 series LDO regulators for next-gen 48V automotive auxiliary batteries. With

an operating current of just 2.0µA and a power-off current of 0.1µA, they significantly reduce standby

drain. Delivering up to 200mA, these compact, automotive-grade ICs enable lighter harnesses, safer ECUs, and efficient always-on mobility systems.

10W DC/DC converter

GAPTEC Electronic's new

10S8W4_2.25RP DC/DC converter

packs reliable power into a compact form, built for demanding industrial environments. With high

efficiency, low standby consumption, and multiple protection features, it ensures stable performance under

harsh conditions. Easy to integrate and versatile, it offers engineers a practical solution for space-limited, energy-conscious, and mission-critical applications.

InGaAs image sensors

Hamamatsu Photonics has unveiled the G1682x series, a compact near-infrared image sensor crafted for

seamless spectrophotometry. Lightweight and versatile, it empowers industries, researchers, and

OEMs with high sensitivity, simple integration, and real-time insights. Designed to boost efficiency across quality control, process optimisation, and R&D, the G1682x series blends reliability with portability, making advanced analysis more accessible than ever.

SiC MOSFETs

Infineon's new 1200 V CoolSiC G2 MOSFETs in top-side-cooled Q-DPAK

packages deliver higher efficiency, lower heat, and reduced energy loss

for EV chargers, solar inverters, UPS, and industrial drives. The compact design simplifies thermal management, supports high power density, and fits automated production. Robust and versatile, these MOSFETs boost system performance while saving energy in demanding applications.

SuperQ MOSFETs

iDEAL Semiconductor's new 200V SuperQ MOSFETs are now in mass production, with additional devices

sampling. The series delivers lower resistance, high-temperature reliability, and improved efficiency, making it ideal

for motor drives, LED lighting, AI servers, USB-PD adaptors, and solar inverters. SuperQ revives silicon innovation, offering designers higher performance without the cost or supply risks of newer materials.

TMR-based magnetic angle sensors

Littelfuse has launched two new TMR-based magnetic angle sensors, LF53466 and LF53464, designed for precise

measurement of angles ranging from 0° to 360°. Built for industrial, automotive, and consumer applications,

they offer high accuracy, thermal stability, and compact packaging. Ideal for robotics, e-mobility, and smart devices, these sensors enable smooth control, precise position tracking, and intuitive feedback in harsh or space-constrained environments.

System-on-chip

MediaTek and TSMC have teamed up to craft a next-generation system-on-

chip built on TSMC's advanced 2nm N2P process. Targeted at smartphones, auto-

motive, computing, and data centres, the chip promises faster performance with lower power use, enabling longer
