

Classification By Speed And Application

This category focuses on operational focus and production goals.

TYPE	DESCRIPTION	KEY SPECIFICATIONS	ADVANTAGES	DISADVANTAGES	TYPICAL USES
High-Speed Chip Shooters	Turret-based for rapid placement of simple components like resistors/capacitors	50,000-100,000CPH; tape feeders; accuracy ~0.1mm; optimised for small SMDs	Fastest for lightweight parts; efficient for high-volume simple assemblies	Limited to low-precision components; requires precision placers for complex parts	Initial placement in SMT lines for resistors/capacitors
Precision Placers	Gantry-based with advanced vision for accurate placement of complex components	5000-30,000CPH; accuracy ±0.01mm; handles fine-pitch (12mil) and large ICs	Superior precision for ICs, BGAs; reliable for fine-pitch and large components	Slower than chip shooters; not suited for ultra-high volumes	Placement of complex components like ICs, connectors, and coils
All-in-One Modular	Multi-headed systems combining speed and precision for versatile production	30,000-200,000CPH; swappable heads; AI/vision integration; handles 01005 to large parts	Versatile for high-mix/low-volume; reduces need for multiple machines; scalable	High cost (\$200,000+); requires advanced software and training	Flexible production from prototypes to mass runs, e.g., IoT devices

Technological Advancements

INNOVATION	BENEFIT
AI-Driven Vision Systems	Real-time component recognition and placement optimisation
IoT and Industry 4.0	Connectivity for predictive maintenance and remote monitoring
Package-on-Package (PoP) and Wafer Placement	Supports advanced assembly like 3D stacking
Open Source Software	Enhances flexibility for custom setups
High-Speed Modular Designs	Combine speed (up to 200,000CPH) with flexibility for high-mix environments
