

With millimetre-level precision, 3D reconstruction, and reflectivity detection for performance across materials, the ME450 reduces integration effort, system complexity, and cost without affecting accuracy.

Radar SoCs

Bosch has launched two new radar SoCs, the SX600 and SX601, enabling driver assistance functions at SAE level 2+ autonomy, including automatic

emergency braking, adaptive cruise control, blind-spot detection,

and lane change assistance. The radar receiver provides dynamic range, ensuring detection of small and distant objects with lower error rates than other sensors. Manufactured using 22nm RF CMOS technology, the SoCs offer computing power, low cost, and around 30% greater detection range than typical radar sensors, while their multicore subsystem allows customer functions to be integrated directly on-chip with room for future upgrades. The chips feature a millimetre-wave sensor frontend and a digital signal processor, supporting both conventional and AI-based data processing for recognition tasks and neural-network-based object detection.

Integrated off-line switcher IC

Power Integrations has launched TinySwitch-5, a fifth-generation integrated off-line switcher IC that delivers

up to 175W output with 92% efficiency using diode rectification and optocoupler feedback. The IC uses a flyback architecture and a control engine to

manage switching frequency and power delivery, maintaining efficiency at light loads. TinySwitch-5 is used in bias and auxiliary supplies for appliances, computing, communications, industrial, and medical applications. It was the first in the family to include EcoSmart technology, which has saved an estimated 200 terawatt-hours of electricity. The company says the IC enables designers to scale up power while meeting efficiency and standby power requirements.

Elastic memory fabric system

Enfabrica Corporation has launched the Elastic Memory Fabric System (EMFASYS), a hardware and software

solution that improves compute efficiency for large-scale, memory-

bound AI inference workloads. It targets generative and reasoning AI tasks, which require 10-100 times more compute per query than earlier LLM deployments and produce billions of batched inference calls daily. EMFASYS increases GPU and HBM efficiency by offloading HBM to DRAM, distributing token generation across AI servers, and reducing idle GPU cores. At scale, it can reduce the cost per token per user by up to 50%, support tiered price-performance models, deliver 100 times lower latency than flash storage, and provide unlimited write-erase cycles.

IoT control platform

Advantech has introduced the AMAX IoT control platform, a PC-based system that combines PLC, HMI, and IoT functions into a single software-defined solution for automation. Using EtherCAT industrial Ethernet and real-time operating systems, it delivers microsecond-level precision for

semiconductor manufacturing, high-speed assembly, and vision-integrated production. The platform supports the IEC 61131-3 programming environ-

ment for migration from traditional PLC systems, including

motion control and robotics, while allowing manufacturers to reuse existing applications. Its IoT functions enable scalable monitoring and control for energy infrastructure, and its unified architecture lets machinery makers integrate automation without redesigning equipment, serving applications in automation, energy storage, and machinery.

245.76TB NVMe SSD

Kioxia Corporation has introduced a 245.76TB NVMe SSD to its KIOXIA

LC9 series, available in 2.5-inch (6.35 cm) and EDSFF E3.L form factors. Claimed as the industry's first at this capacity, it complements the 122.88 TB 2.5-inch (6.35cm) model. The drives are designed for generative AI workloads, including large language model training, embedding creation, and vector database development for retrieval-augmented generation (RAG). Designed for dense storage deployments, such as data lakes, the LC9 series addresses HDD-related GPU utilisation limits. The 245.76TB model can replace multiple HDDs, offering higher performance, lower power consumption, fewer drive slots, and improved cooling, which can reduce the total cost of ownership.
