

plates, and conducting facial and reverse facial recognition for law enforcement,” he adds.

All video and audio data are analysed either on the client’s on-premise servers or private cloud infrastructure, adhering strictly to cybersecurity standards such as GDPR and ISO certifications.

The business model is based on a SaaS subscription. Clients pay on a per-camera basis, ranging from ₹2000 to ₹8000 per month, depending on the features and use cases.

Atul shares that Staqu currently supports over 170 enterprise clients across various sectors, including law enforcement, manufacturing, and retail. Notable clients include Ray-Ban, PVR, Porsche, BlackBerry, Embassy Group, and multiple state police departments across India. Deployments range from major metropolitan areas, such as Delhi and Mumbai, to smaller Tier-2 and Tier-3 cities, including Jaunpur and Mirzapur.

(L-R) Pankaj Sharma, Atul Rai, and Anurag Saini, Co-Founders, Staqu Technologies

Internationally, Staqu operates in nine countries and is expanding into new markets, including the US and the UAE. A Dubai office is underway, and future plans include establishing an R&D lab in academic hubs such as Cambridge or Oxford.

The startup reports that JARVIS handles over 400,000 image frames per second from thousands of cameras, with sub-second analysis latency. Staqu has published more than 25 research papers and holds two patents: one for real-time large-scale video frame analysis and another for privacy-preserving person re-identification

technology that does not rely solely on facial recognition.

Benchmarking on standard datasets, such as LFW2 for visual tasks and VGG VoxCeleb for audio, shows accuracy levels between 98% and 99.7%, outperforming even some leading academic institutions.

The mobile accessibility of JARVIS enables users to monitor live streams, receive alerts, and query data through a dedicated app.

Atul notes that Staqu has achieved significant growth, with ARR rising from ₹25-30 million in 2022 to around ₹400 million in 2025, multiplying about 15 times. The company reports zero customer churn and maintains a 6% EBITDA profit margin, notable in the AI sector.

The company plans to expand into the B2C market within the next year, aiming to democratise access to AI-powered surveillance for individuals and smaller businesses.

2 “OUR SATELLITES DELIVER INSIGHTS IN MINUTES, NOT DAYS”

What if satellites could independently choose the most valuable data to solve problems on Earth? SkyServe, based in Bengaluru, is bringing that idea to life.

Vinay Simha, Vishesh Vatsal, and Adithya K started their journey together while working at an aerospace company called Team Indus, building India’s first private lunar rover. There, they focused on creating a spacecraft for lunar landings and a lunar rover that would compete under the Google Lunar X Prize.

After leaving the company, the three co-founded a startup named SkyServe. They started seeking ways to apply their expertise with greater commercial impact. Since deep space missions often take many years to

show business value, they turned their attention to Earth observation. As AI and deep learning began to emerge in the space sector, they identified a promising opportunity

to innovate.

The startup claims to design the technology for smarter satellites. The smart satellites could, for instance, recognise in real time which parts

of the Earth were covered in clouds and avoid sending that data. Instead, they can focus only on clear areas, making much better use of the available communication bandwidth. Beyond
